

LIGHT CURTAIN

INFRA RED SAFETY BEAM CURTAIN

MAX HEIGHT **2.5M**

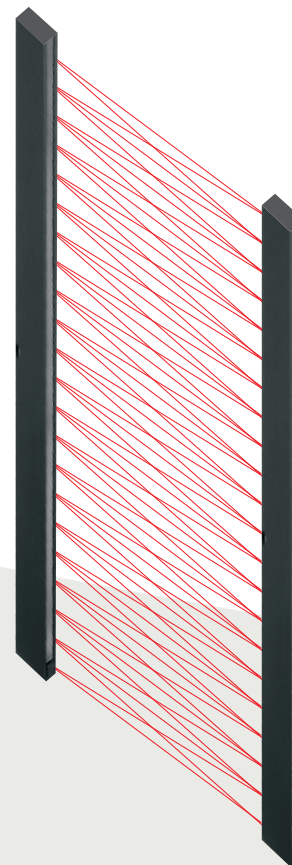

MASTER SLAVE SYSTEM **YES**

MAX RANGE **14M**

Light curtains are gaining in popularity due to them being simple to use and extremely effective as a safety system. The system works by using two rows of LED infrared lights fired in sequence to cover an entrance way in a lattice of infra red beams. These systems are perfect for fast moving gates or very large heavy gates, where you do not want the gate to ever come into contact with an obstruction such as a vehicle or pedestrian.

This is the only type of photocell which can pass current health and safety regulations on its own as the whole entrance is covered, making it impossible to reach the gate without triggering the safety device.

- Light curtains can be any height up to approximately 2.5m
- 10m range as standard 14m range alternative available on requested
- Internal computer system allows the curtain to continue working even when partially covered in mud, rain and other sources of contamination.
- The only fully certified device that can be used in isolation to make a gate safe and compliant
